

MAI

NETWORK

OFFICIAL WHITEPAPER

Building an accessible, transparent and community-driven digital mining ecosystem on TON

Network	The Open Network (TON)
Token	MAI
Total Supply	10,000,000,000 MAI
Version	1.0 - September 2026

Mining • Access • Innovation

Contents

This whitepaper is organized into the following sections.

01	Project Overview
02	Tokenomics
03	Technology & Security
04	Liquidity & Sustainability
05	Roadmap
06	Risk & Legal

Document principle: current capabilities and future objectives are clearly distinguished.

Executive Summary

MAI Network is a blockchain-oriented digital mining ecosystem designed to make participation in the digital economy simple, accessible and transparent. Built around Telegram and The Open Network (TON), the ecosystem connects a Telegram Mini App, backend services, persistent data, wallet connectivity and the MAI token.

MAI is designed as an ecosystem asset rather than a promise of financial return. The project seeks to connect participation, mining rewards, token utility, community growth and future TON-based services under a sustainable model.

Vision and Mission

Vision: build an accessible digital ecosystem where ordinary users can participate in blockchain technology without requiring advanced technical knowledge.

Mission: simplify access, provide understandable reward rules, develop MAI utility, protect legitimate participation, scale infrastructure responsibly, integrate TON services and continuously improve security and transparency.

MAI: Mining - Access - Innovation

M - Mining: structured ecosystem rewards and progression. A - Access: easier blockchain participation through Telegram. I - Innovation: continuous development of technology, utility and ecosystem services.

Problem and Opportunity

Blockchain remains difficult for many new users because of complex wallets, interfaces and terminology. Reward platforms can also be harmed by unsustainable emissions, fake accounts, automated scripts and unclear reward calculations.

MAI Network addresses these challenges through transparent tokenomics, server-authoritative reward logic, persistent account data, wallet integration and defined platform rules.

Design principle: transparency, server authority and finite-supply sustainability.

MAI Ecosystem

The ecosystem consists of the MAI Telegram Mini App, mining and progression systems, MAI token, TON blockchain, TON Connect wallet connectivity, backend services, persistent database infrastructure and the MAI community.

These components are separated so that the user interface does not become the authoritative source of financial or reward data.

Telegram Mini App

Telegram is the primary access layer. The Mini App is intended to provide mining, levels, tasks, referrals, wallet connectivity, reward balances, withdrawal functions, community activities and future utilities without requiring a separate application installation.

Mining System

MAI mining is a digital ecosystem reward mechanism and is not Proof-of-Work mining performed by physical hardware. Eligible users accumulate rewards according to platform rules and progression requirements.

Mining parameters may evolve to protect the finite reward pool. Material changes should be communicated through official MAI channels.

Levels, Mining Power and Holding

The progression model can link mining capacity to levels, eligible activity and MAI holding requirements. Holding rules connect participation with the MAI economy and can be used to unlock or maintain defined mining capabilities.

Rates and requirements should be displayed transparently in the platform. Adjustments may be introduced to preserve long-term sustainability.

Tasks and Referrals

Tasks may include official community joins, verified platform activities, educational actions, campaigns and partner activities. Reward eligibility may require server-side verification.

The referral system is intended for legitimate organic growth. Fake referrals, self-referrals, automated account creation, multi-account abuse, referral farming and manipulated claims may be restricted.

Wallet Integration and User Custody

MAI Network uses TON-compatible wallet connectivity through TON Connect. Users retain custody of their wallets and are responsible for seed phrases, private keys and device security.

MAI Network should never require a seed phrase for normal operation.

Design principle: transparency, server authority and finite-supply sustainability.

Tokenomics and Distribution

Fixed planned total supply: 10,000,000,000 MAI

Allocation	Percentage	Amount
Mining Rewards	70%	7,000,000,000 MAI
Founder	10%	1,000,000,000 MAI
DEX & Liquidity	10%	1,000,000,000 MAI
Community	10%	1,000,000,000 MAI
Total	100%	10,000,000,000 MAI

Mining Rewards - 70%

7 billion MAI is reserved for progressive mining distribution. Emission should be managed according to active users, mining rates, ecosystem sustainability, abuse prevention and long-term distribution objectives.

Founder - 10%

1 billion MAI supports long-term development, leadership and operations. Vesting, locking or transparent wallet disclosure may be introduced as the project matures.

DEX & Liquidity - 10%

1 billion MAI is reserved for liquidity pools and market infrastructure. Allocation to this reserve does not mean the entire amount enters circulation at once.

Community - 10%

1 billion MAI may support campaigns, education, partnerships, contributor rewards, community incentives and future ecosystem programs.

System Architecture

The architecture separates user interface, authoritative backend logic, persistent storage, wallet connectivity and on-chain settlement.

MAI Token

Token name: MAI. Symbol: MAI. Blockchain: TON. Total planned supply: 10,000,000,000 MAI.

MAI is intended to support the economic layer of the ecosystem, including rewards, participation requirements, community incentives, platform services, partner integrations and future utilities.

Token Utility

Potential utility includes mining participation, level and holding requirements, ecosystem rewards, community incentives, platform services, partner integrations, future MAI applications, governance research and additional TON ecosystem utilities.

Future utilities are development objectives and are not represented as currently available unless officially released.

Technical Architecture

The frontend provides the Telegram Mini App interface. The backend processes authoritative logic for authentication, rewards, progression, tasks, referrals, withdrawals and security checks.

Persistent storage maintains critical account records. TON provides on-chain settlement and asset ownership, while TON Connect provides wallet connectivity.

Server-Side Reward Architecture

Critical reward values should be validated and maintained by backend systems rather than trusting client-side state. This reduces manipulation through browser developer tools, modified JavaScript, local storage changes, automated API abuse and forged reward requests.

No system can guarantee perfect security; defenses must evolve with new threats.

Design principle: transparency, server authority and finite-supply sustainability.

Database Infrastructure

Persistent server-side records may include user accounts, mining states, balances, levels, tasks, referrals, withdrawals, transaction records, security events and audit logs.

Reliable storage is essential for account continuity, reconciliation and recovery.

Security and Anti-Cheat

MAI Network may apply Telegram authentication validation, request validation, rate limiting, database constraints, duplicate-request protection, transaction locking, idempotency controls, withdrawal validation, abuse monitoring, administrative review, logging and infrastructure monitoring.

Automated mining scripts, API manipulation, fake accounts, multi-account abuse, referral farming, task manipulation, modified clients, withdrawal exploits and duplicate transactions may result in rejected rewards, suspended withdrawals or restricted access under platform rules.

Withdrawal Framework

Eligible users may request withdrawals according to the current platform rules. Minimum amounts, fees, verification requirements and processing procedures may evolve as the network develops.

Security checks may be applied before completion to protect the reward reserve and legitimate users.

DEX and Liquidity Strategy

10% of supply is reserved for DEX and liquidity purposes. Deployment should consider available capital, circulation, pool depth, price impact, volatility, smart-contract risk and sustainable growth.

MAI Network does not guarantee a market price. Tradable value is determined by market participants, liquidity, utility, demand and broader market conditions.

Sustainability

Because the mining allocation is finite, emission management is essential. Potential mechanisms include progressive mining difficulty, rate adjustments, level requirements, holding requirements, reward limits, anti-abuse controls, utility expansion and controlled emissions.

Development Roadmap

MAI NETWORK - DEVELOPMENT ROADMAP

Phase 1 - Foundation

MAI concept, token creation, tokenomics, Telegram ecosystem, mining architecture and community foundation.

Phase 2 - Platform Development

Telegram Mini App, mining, levels, tasks, referrals, TON wallet integration, backend services and persistent database.

Phase 3 - Security & Scalability

Backend-authoritative rewards, anti-cheat, API protection, database optimization, monitoring, security auditing and scalability improvements.

Phase 4 - Token Economy

Utility expansion, mining/holding integration, liquidity deployment, DEX integration, circulation strategy and ecosystem partnerships.

Phase 5 - Ecosystem Expansion

Additional utilities, partner integrations, community programs, advanced account features, broader TON integration, governance research and additional services.

Roadmap items are development objectives and may change with technical, regulatory, financial or market conditions.

Community and Transparency

The community is a core component of MAI Network. Sustainable growth requires communication, education, feedback, responsible participation and long-term development.

Transparency objectives include clearly defined supply and allocation, public blockchain transactions where applicable, official development updates, understandable ecosystem rules and communication of significant changes.

Governance Direction

MAI Network may research community governance as the ecosystem matures. Any governance model would require technical, security and economic design before implementation. Governance is not represented as operational unless officially released.

Risk Disclosure

Digital assets involve risk, including price volatility, liquidity limitations, smart-contract vulnerabilities, blockchain congestion, wallet compromise, regulatory changes, infrastructure failures, cyberattacks, technical bugs and third-party failures.

MAI Network does not guarantee profits, investment returns or future token prices. Users should independently evaluate risks before acquiring, holding, trading or using digital assets.

Legal and Regulatory Considerations

Digital-asset laws differ by jurisdiction and may change over time. Features may need to be modified, restricted or unavailable in particular jurisdictions. Users are responsible for understanding laws applicable to them.

Design principle: transparency, server authority and finite-supply sustainability.

Whitepaper Disclaimer

This document describes the current vision, architecture and intended direction of MAI Network. It is not financial, investment, legal or tax advice. Technical specifications, mining parameters, ecosystem features, timelines and roadmap items may change as development progresses.

Future features are objectives rather than guarantees unless officially released. Updated whitepaper versions may be published when material changes occur.

Conclusion

MAI Network is being developed as an accessible, secure and sustainable digital mining ecosystem connected to Telegram and TON. With 70% of the supply allocated to mining rewards, user participation is central to the distribution model.

The project aims to progressively build infrastructure, utility, security, liquidity and community around MAI. MAI - Mining, Access, Innovation.
